

## LAB PROJECT

Name: Aditya Kumar - 2019506007

This a hotel booking website using html, css, javascript, php and mysql.

Introduction: Here, separate html and separate php files are used.

On opening home page title as lab\_project.html, please read the instructions and go to register link to create an account.

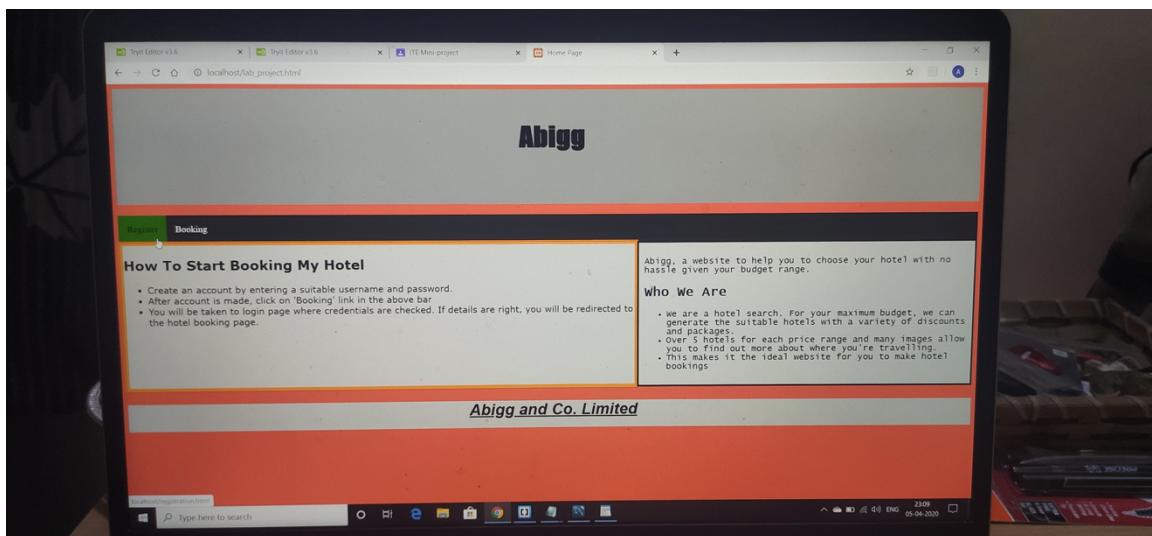

Once account is created, you can login by clicking on Booking tab and once username and password matches with existing username and password in database, it redirects to Book Hotel page.

On entering the budget per night, variety of hotels and upon clicking 'show details' button, for each hotel a brief description is provided.

To confirm your booking, please fill out the form and confirm for details to get stored in the database, and receipt is generated at the end.

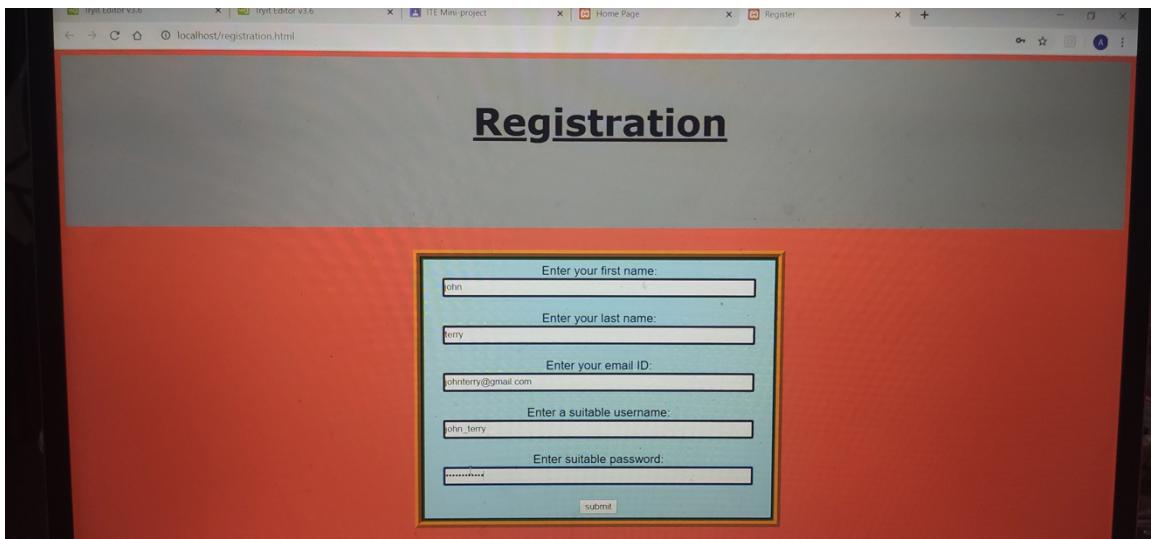

Explanation:

Let us open the home page.

Now as we read the instructions, we will proceed and create an account.

Let us keep the name as 'John Terry'.

Registration

Enter your first name:  
john

Enter your last name:  
terry

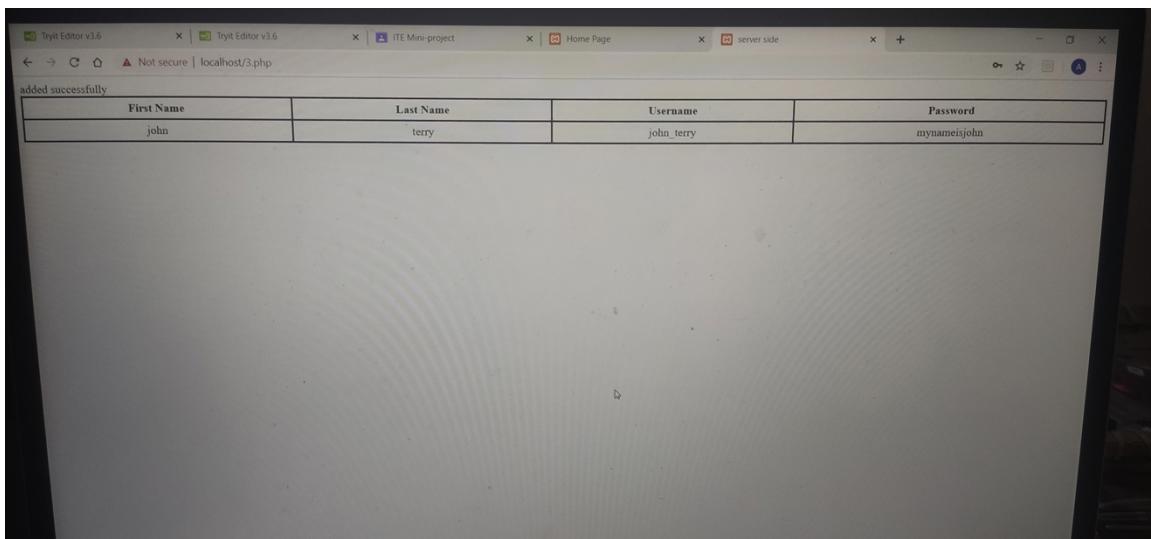

Enter your email ID:  
johnterry@gmail.com

Enter a suitable username:  
john\_terry

Enter suitable password:  
\*\*\*\*\*

submit

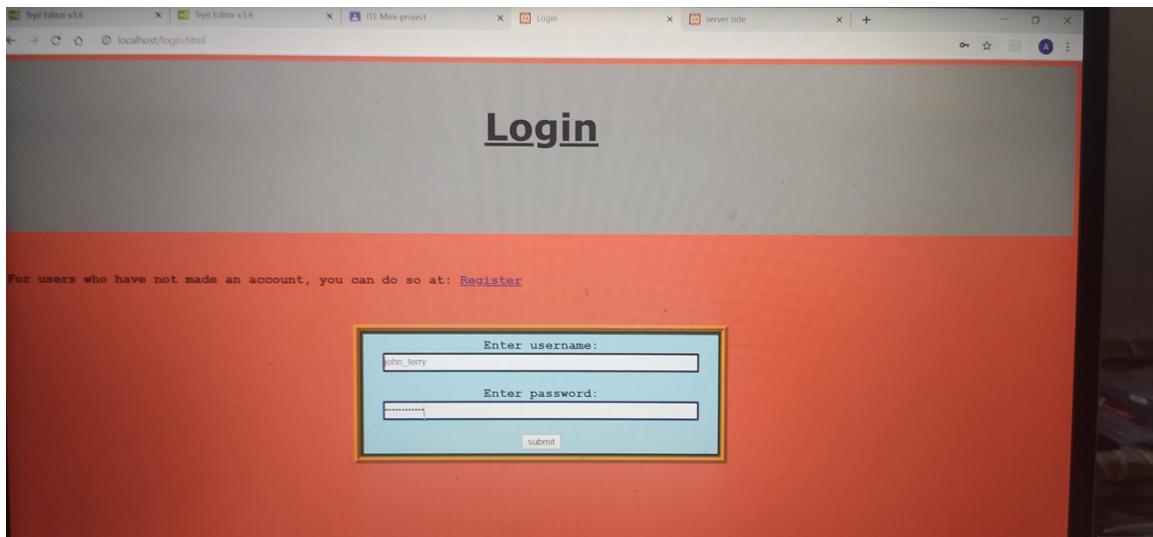

Now as we hit submit, we can see it is stored in our database.

added successfully

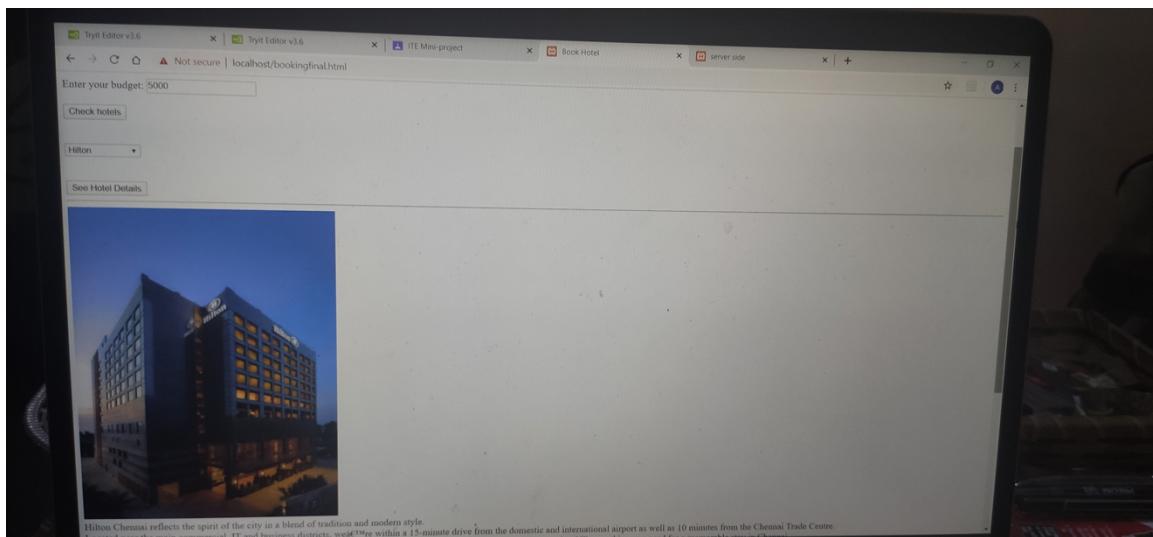

First Name	Last Name	Username	Password
john	terry	john_terry	mynamenameisjohn

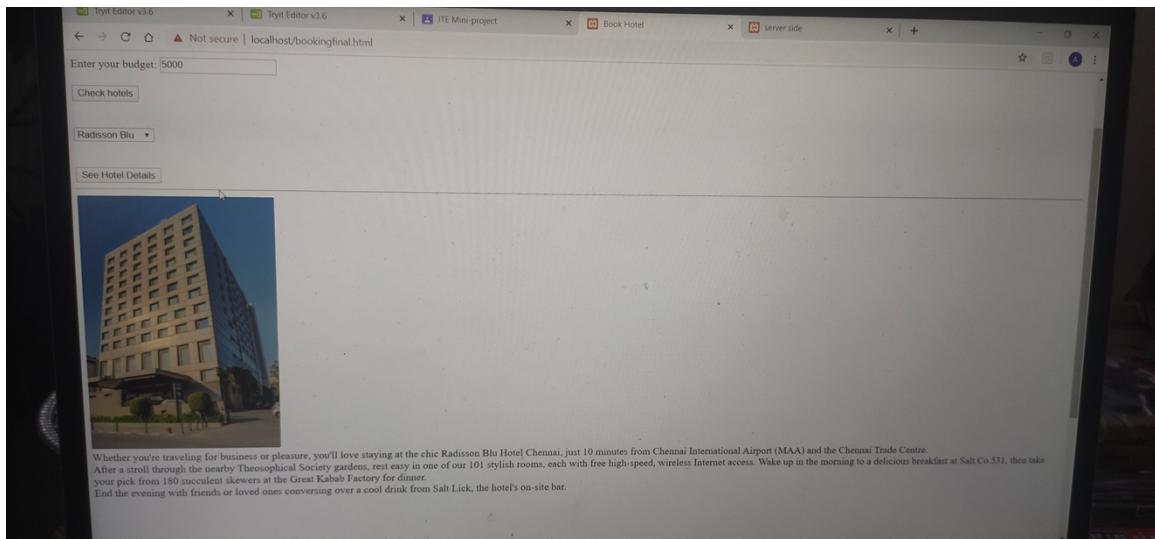

Now login with that username and password. If matching, you will redirected to the book hotel page. Else incorrect.

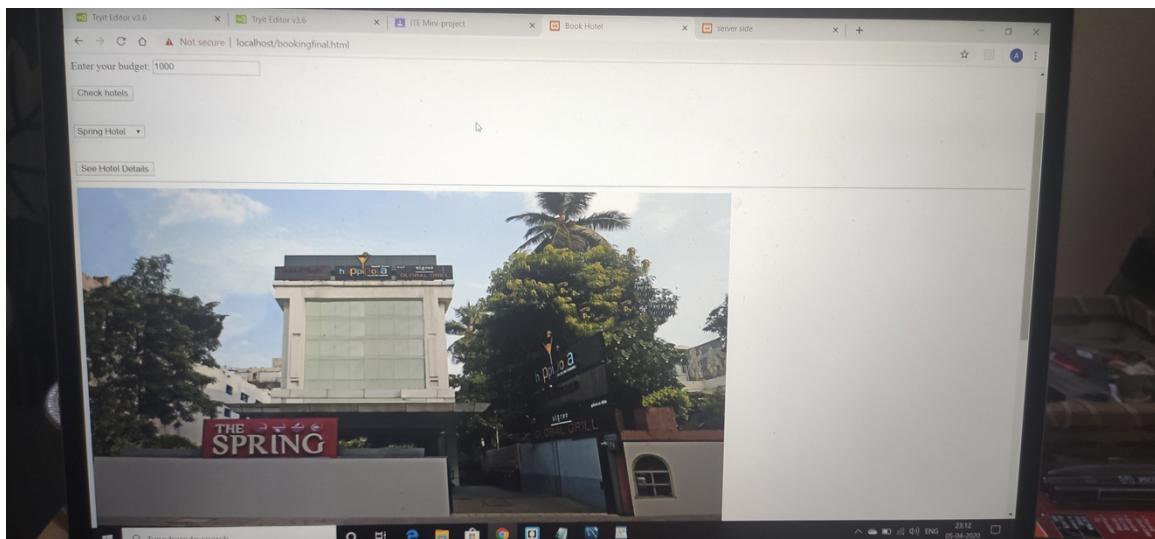

View of the book hotel page with descriptions for various hotels.

Just some examples....

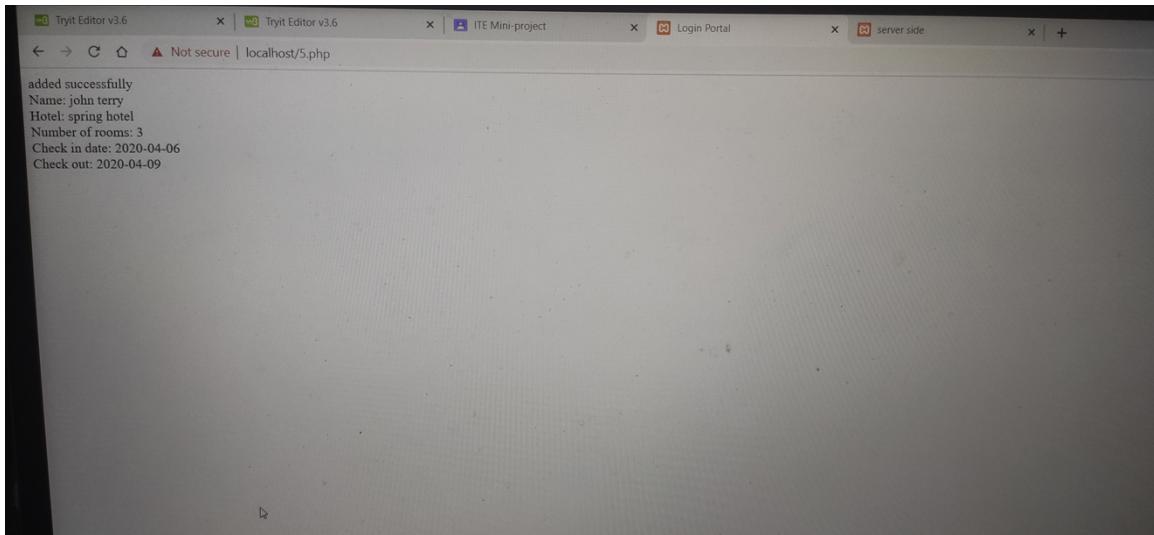

But we are giving a budget of 1000, which generates a different variety of hotels from which we shall select spring hotel. Then we shall enter the form and enter our username to confirm.

Now once confirmed, the receipt is generated for us to see.

Hence, a booking is successfully done through this website.
